

α -collision threshold sweep

Date: 2026-05-21 · **Scope:** 4 model configurations × 2 benchmarks × 4 α arms

Quick reference for the α -sweep results across the instruct models we've completed end-to-end, plus Qwen3-8B with thinking disabled as the decisive-test control for the thinking-vs-saturation question. All numbers below are extracted live from the metrics JSONs at the paths cited beneath each table; every plot is rendered from the same data.

Scope

Dimension	Value
Model configurations	Qwen2.5-Coder-7B-Instruct, CodeLlama-7B-Instruct, OpenCodeInterpreter-DS-1.3B, Qwen3-8B-NoThink
Datasets	MBPP, HumanEval (MBPP-500, HumanEval-164)
α grid	2.0, 2.5, 3.0, 5.0
Temperature	T=1.0 (fixed; α is the sweep parameter)
Samples per task	10

Metrics shown: pass@k for k in {1, 3, 5, 10} (Chen et al. 2021 unbiased estimator) and CodeBLEU pairwise diversity.

Figure 15: pass@k vs k

Figure 16: pass@10 vs CodeBLEU diversity

Key qualitative observations

1. **pass@k grows monotonically with k** at every α arm for every (model, dataset) cell — expected from the Chen et al. estimator’s construction; included for completeness.
2. **CodeBLEU diversity grows monotonically with α** at every (model, dataset) cell — see the dashed α -trajectory lines in the scatter plots curving rightward as α grows.
3. **pass@1 mildly decreases with α on the 3 non-thinking models** (typical -1.4 to -3.0 pp from $\alpha=2$ to $\alpha=5$). pass@10 typically grows.
4. **The 3 models occupy distinct operating regimes**: Qwen2.5-Coder is the strongest ($>87\%$ HE pass@10), m-a-p OCI is mid-strength ($>75\%$ HE pass@10 at small size), CodeLlama is the weakest ($<50\%$ on HE).
